GRADE 9 MATHEMATICS
FULL-YEAR SCHEME OF WORK

Academic Year: _____ **School:** _____ **Teacher:** _____

Planning note: This is an original teacher-prepared planning document aligned to the Grade 9 KICD Mathematics curriculum design. The curriculum design gives suggested lesson allocations; the school should adjust pacing to its approved calendar, learner progress and available resources. The KICD sub-strand lesson counts visible in the design summary total 146; the remaining four lessons in this 150-lesson planning frame are reserved for diagnostic orientation, consolidation and end-year transition.

TERM 1 — 55 planned curriculum lessons

Suggested school-calendar window: 14 weeks. The remaining timetable periods may be used for revision, CATs, projects, remedial/enrichment activities, examinations, feedback and school-based activities.

WK	LSN	STRAND	SUB-STRAND	LESSON LEARNING OUTCOMES	LEARNING EXPERIENCES	KEY INQUIRY QUESTIONS	LEARNING RESOURCES	ASSESSMENT METHODS	REFLECTION
1	1	Orientation / Consolidation	Introduction and diagnostic assessment	At the end of the lesson, the learner should be able to: 1. Knowledge: The learner should be able to recall prerequisite knowledge, identify learning needs and set personal improvement goals. 2. Skills: The learner should be able to apply the concepts and procedures in introduction and diagnostic assessment to solve relevant mathematical and real-life problems, showing clear working and checking answers. 3. Attitude: The learner should demonstrate confidence, accuracy and perseverance when working mathematically.	The learner is guided to explore introduction and diagnostic assessment using relevant examples and available learning resources; work out examples individually and in pairs; draw, construct or interpret mathematical representations where appropriate; discuss strategies and compare solutions in groups; present and explain findings; and practise solving related mathematical and real-life problems.	What strategies help us identify strengths and areas for improvement in Mathematics?	Learner's book; teacher-prepared notes; charts; number line/graph paper; geometric instruments; locally available materials; calculator where appropriate.	Oral questions; observation; class exercises; written tasks; peer/self-assessment; practical task; exit ticket.

WK	LSN	STRAND	SUB-STRAND	LESSON LEARNING OUTCOMES	LEARNING EXPERIENCES	KEY INQUIRY QUESTIONS	LEARNING RESOURCES	ASSESSMENT METHODS	REFLECTION
				learner should show curiosity and make reasoned judgements when dealing with uncertainty.					
8	5	Data Handling and Probability	Probability	At the end of the lesson, the learner should be able to: 1. Knowledge: The learner should be able to describe likelihood and determine probabilities of simple events within the grade-level scope. 2. Skills: The learner should be able to apply the concepts and procedures in probability to solve relevant mathematical and real-life problems, showing clear working and checking answers. 3. Attitude: The learner should show curiosity and make reasoned judgements when dealing with uncertainty.	The learner is guided to explore probability using relevant examples and available learning resources; work out examples individually and in pairs; draw, construct or interpret mathematical representations where appropriate; discuss strategies and compare solutions in groups; present and explain findings; and practise solving related mathematical and real-life problems.	How can probability help us describe uncertainty and make predictions?	Learner's book; teacher-prepared notes; charts; number line/graph paper; geometric instruments; locally available materials; calculator where appropriate.	Oral questions; observation; class exercises; written tasks; peer/self-assessment; practical task; exit ticket.	

Teacher's reflection on the term: _____

_____

Annual pacing and assessment guidance

This scheme places 55 curriculum lessons in Term 1, 55 in Term 2 and 40 in Term 3 (150 total). Because the user's school calendar has 14, 13 and 9 weeks respectively, the unused lesson slots are deliberately left for assessment, revision, projects, remediation, enrichment, feedback and school events. Re-sequence only where the school calendar or learner progress requires it, while maintaining prerequisite progression.

Assessment evidence should be continuous and varied: diagnostic tasks, oral questioning, observation, written exercises, problem-solving, practical measurement, projects, peer assessment and end-of-topic tests. Record learners requiring support and plan targeted remediation or enrichment.
